FAIRODDS

Your side. Your stake.

Transparent sports pools on Solana devnet.

A wallet signs the bet. Programs hold the rules and custody.

THE PROBLEM

Players need verifiable rules.

Opaque pools, custody and discretionary resolution make traditional betting difficult to verify.

FairOdds exposes pool balances, deadlines, immutable feed addresses and receipts on-chain.

MATCH MARKETS

0.5% of positive profit.

100 demo-USDC stake + 400 gross payout = 1.50 fee + 398.50 net.

No protocol fee on refunds. Existing policy-free markets retain 0%. Pool odds change until cutoff.

SEASON MARKETS

The full principal goes to winners.

Champion and top-scorer pools support 2-32 participants. Every deposit parks immediately.

0% protocol fee. Funded demo reserve surplus goes to treasury. No deployed Kamino or guaranteed APY.

SETTLEMENT

Two feeds. One result.

Season providers must agree on a mapped participant after the league is final.

Pinned addresses and hashes, locked feed authority, timestamp checks. Missing data eventually enables refunds.

PLAYER EXPERIENCE

One interface. Any screen.

English / Polish, mobile layouts, live pools and clear kickoff times.

Claim controls distinguish winners, losers, refunds and already received funds. Empty sides never show fake odds.

OPEN INTEGRATIONS

Built for people and bots.

Solana Actions / Blinks + public REST + agent tools.

The API prepares unsigned transactions. Wallets and starter bots verify and sign locally.

DEVNET PROTOTYPE

Ready for owner deployment.

Local SBF integration tests, exact-money API tests and production build.

Upgrade both programs, configure provider keys / Redis / keeper, then record a real wallet run. Mainnet and production lending require separate review.
